

I already set up my own web hosting server at my home.

But it's not so powerful. It has only 320 GB HDD and 4GB RAM with Corei3 processor. I have only one real IP. For more IP, I need a corporate internet connection. But its too expensive for me right now.

For this reason, I've started free web hosting service in TOR Network . I already have a free SMS system for Bangladeshi people. (BD GO SMS) <https://www.bdgosms.com> it's available in the play store too.

I want to start a company related to technology and ICT . Example Web hosting, Cloud server & data center, IT solution, web design, and many web services. I want to start with web hosting Service. I would like to start with a reseller web hosting & with my own VPS and dedicated server.

But I don't have enough money to buy a server. If i can start in anyway, I hope , I'll be able to add a lot of more service soon. And I would like to add special opportunities for students and teachers for web hosting and cloud service.

And my dream, it will be a multinational company.
